## CONCLUSIONS

- System of small permanent walls and/or mobile flood protection barriers built over existing boulevards and levees was chosen:
  - to protect Cracow against flood p=0,1%,
  - to minimize the negative impact of the enlargement of the levees on the landscape,
  - due to a problem with a limited place to widen the levee
- This system is a good solution, comparing the significant effect of flood protection to the funds spent and the relatively short time needed to improve the flood safety of the Cracow city
- The water level in Cracow during flood in 2010 was significantly reduced by the Świnna Poręba dam and by three failures of the levees on the Vistula river before Cracow
- Water level during flood in 2010 (p=1%) wasn't enough high to touch new system of mobile flood protection barriers
- However for a long term the risk of floods grater than p=1% in Cracow should be limited. This may endanger the safety of the Dębnicki Bridge and it cause significant damages to the bed and boulevards For this reason, work is currently underway to develop a large polder system before Cracow
